

Sabre Red 360 requires connectivity to the following URL's, IPs, and Ports. The following information should be whitelisted in firewalls or correctly configured proxies.

- Sabre (current data centers hosted in Tulsa) hosted URL's are in the 151.193.0.0/16 CIDR
Note: *All Sabre resources hosted in Tulsa will start with the 151.193 IP range.*
- New IP addresses outside of existing Sabre IP ranges will be in use. New IP addresses are subject to change without prior notification. **Be certain to create safelists using domain names - FQDN - do not use IP addresses.**
- Access should be granted for **sabred.exe**, **chromium.exe** and **java** through any security solutions including anti-virus, anti-malware, appliances, etc...
 - Java is supplied by and isolated to Sabre Red.
 - Current version is OpenJDK JRE 8u282
- If "SSL Interception" IP changes are done, it is possible that an incorrect SSL Cert may be presented to the client and access to the URL will be denied. This will prevent the application from operating.

Validation of the following URLs can be accomplished with TELNET URL Address PORT#

Example: TELNET ACCESS.HAVAIL.SABRE.COM 30031

This document is designed for new installations and to reflect changes to the connectivity guidelines for existing Sabre Red installations. Some of the services may have multiple (URL's) endpoints. There is a recommended or primary URL and there are additional fallback URL's. We recommend that installations of Sabre Red use the Single EXE and use the recommended URL's where stated. But an existing customer may still be on a legacy installation which will not support the change in end point until they upgrade to the Single EXE installer.

Note: *This document no longer reflects legacy URLs that are on a sunset path. For existing customers looking for documentation with legacy URLs, please contact your local support desk.*

Name/Service	Port	IP(s)	URL and recommendations
Application Authentication Api.platform.sabre.com	443	Multiple (Imperva) IPs	https://api.platform.sabre.com <i>Served from a CDN outside of Sabre network, requires traffic to FQDN open.</i> Recommended
